

1. IDEATION PHASE

ServiceNow-Based Employee Laptop Request Application

Prepared By: Nadakuditi Bindu

1.1 Problem Discovery

The project began with a simple business problem: employee laptop requests need a centralized and controlled process. Manual communication can make request information, approvals and status difficult to manage consistently. The proposed ServiceNow solution focuses on creating a single digital entry point and a defined request lifecycle.

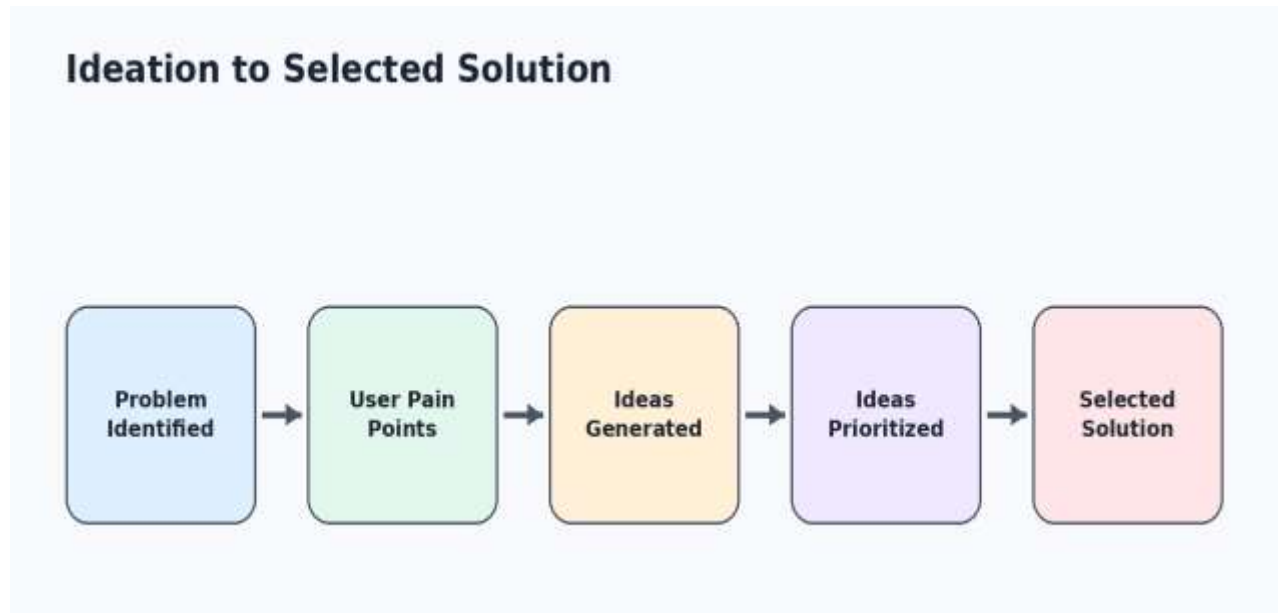

1.2 Stakeholder Needs

Stakeholder	Need	Expected Benefit
Employee	Simple request submission and clear status	Less manual follow-up
Manager	Controlled approval of employee requests	Better accountability
IT Team	Centralized request records and access control	Improved visibility and administration
Organization	Consistent request policy	Standardized process

1.3 User Pain Points

- Requests can be handled outside a centralized system.
- Duplicate laptop requests need to be prevented.
- Approval status needs to be visible and traceable.
- Employees need confirmation when an approval decision is made.
- Different users require different access levels.

1.4 Ideation Workflow

1.5 Brainstormed Solution Areas

Area	Idea	Reason for Inclusion
Submission	Employee Service Catalog + Record Producer	Creates a simple front-end entry point.
Data	Custom Laptop Request table	Provides centralized structured storage.
Validation	One request per employee per calendar year	Enforces the defined policy.
Approval	Manager approval through Flow Designer	Creates an automated approval stage.
Communication	Approval / rejection emails	Keeps the employee informed.
Security	Roles, groups and ACLs	Restricts access according to responsibility.

1.6 Idea Prioritization

Priority	Selected Capability	Decision
High	Centralized request submission	Core
High	Annual duplicate validation	Core
High	Manager approval automation	Core
High	Status and notification handling	Core
High	Role-based access	Core

1.7 Selected Concept

The selected concept is a ServiceNow-Based Employee Laptop Request Application using a custom table, Record Producer, Business Rule, Flow Designer, approval handling, notifications and role-based security. The concept directly addresses the identified request, approval, validation and access needs.

1.8 Ideation Outcome

The ideation phase converted the business problem into a focused ServiceNow solution concept. The next phase translates this concept into measurable business, functional, data and security requirements.
