

5. PROJECT DEVELOPMENT

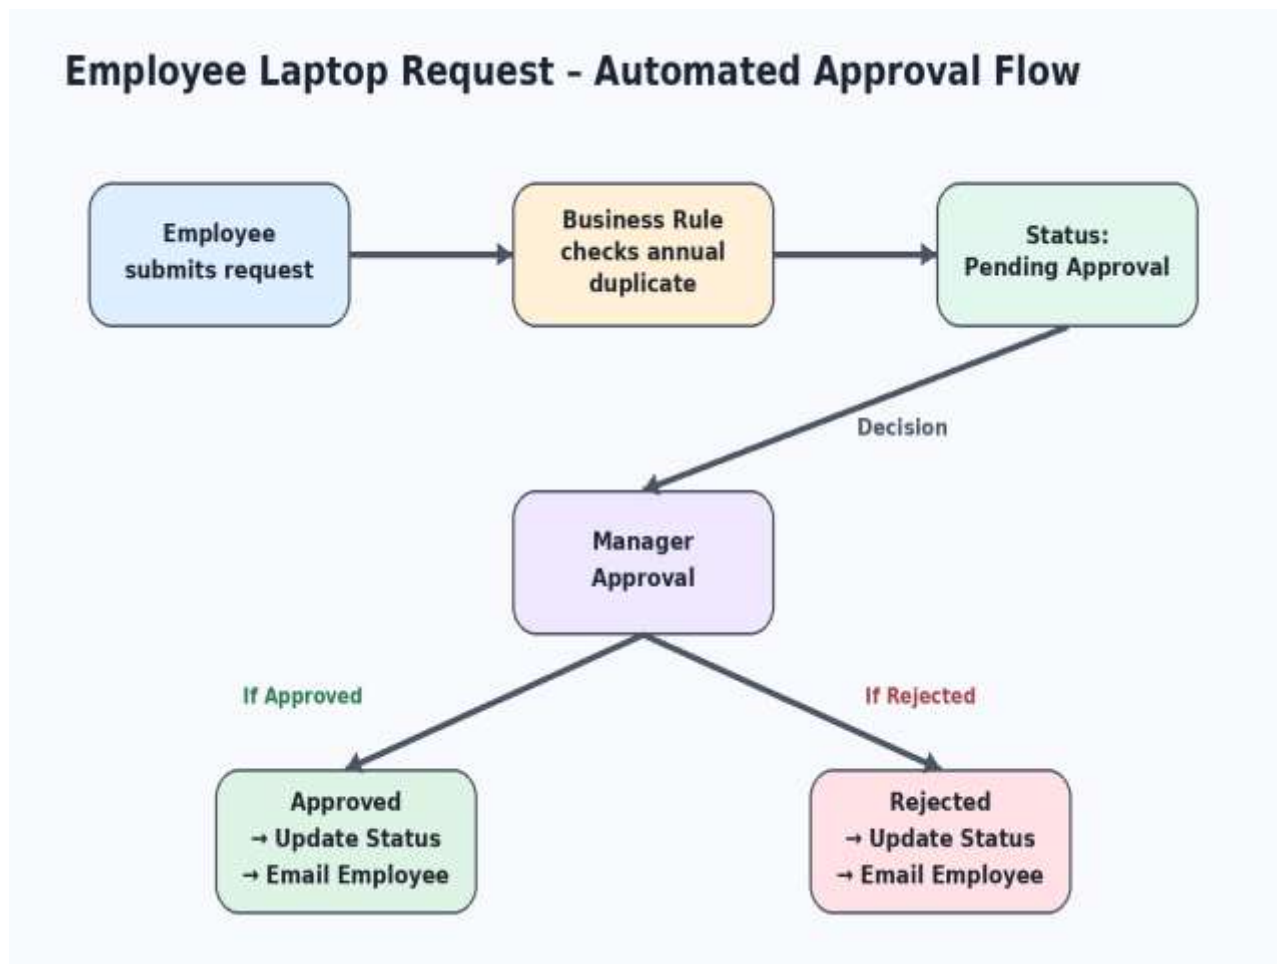

ServiceNow-Based Employee Laptop Request Application

Prepared By: Nadakuditi Bindu

5.1 Development Overview

Development converted the approved design into ServiceNow configuration. The implementation covers the request data model, employee submission interface, annual validation, manager approval automation, security controls and testing.

5.2 Development Workflow

5.3 Application Foundation

Item	Implemented Configuration
Update Set	Created and made current before development.
Application	Custom scoped application.
Table	Laptop Request – x_2063774_projec_0_laptop_request.

5.4 Record Producer Implementation

- Created Record Producer named Laptop Request.
- Selected the Laptop Request table.
- Added variables required by the request.
- Matched variable types with table field types.
- Mapped variables to the corresponding table fields.
- Added the producer to the Employee Service Catalog.

5.5 Business Rule Implementation

Laptop Request BR executes before insert. It identifies the requester, checks for an existing laptop request and evaluates whether that request belongs to the current calendar year. If a matching request exists, the new submission is blocked.

Configured outcome: “Request Blocked – Employee already has a laptop request for the current year.”

5.6 Flow Designer Implementation

Flow Stage	Action
Trigger	Laptop Request record is created.
Initialization	Request status is set to Pending Approval.
Approval	Ask for Approval using the Manager reference.
Decision	Evaluate approval or rejection.
Approved Path	Set status to Approved and send email to requester.
Rejected Path	Set status to Rejected and send email to requester.

5.7 Security Implementation

Security Element	Implementation
Role	it_employee – create and manage laptop requests
Role	it_manager – view laptop requests
Group	IT Employees – it_employee role
Group	IT Managers – it_manager role
ACL	Manager: Read
ACL	Employee: Read + Create + Write

5.8 Functional Test Results

Scenario	Expected Result	Result
Employee creates request	Request created	Passed
Employee edits request	Edit allowed	Passed
Second request in same year	Request blocked	Passed
Manager views request	Access allowed	Passed
Manager creates request	Access blocked	Passed
Manager edits request	Access blocked	Passed
New request	Pending Approval	Passed
Manager approves	Approved	Passed
Manager rejects	Rejected	Passed
Approval notification	Employee notified	Passed
Rejection notification	Employee notified	Passed

5.9 Development Outcome

The implemented configuration passed the defined functional and security scenarios. The completed lifecycle demonstrates that submission, validation, approval, status management, notifications and access controls work together as designed.
