

6. PROJECT DOCUMENTATION

ServiceNow-Based Employee Laptop Request Application

Prepared By: Nadakuditi Bindu

6.1 Document Purpose

This document provides a concise technical record of the completed ServiceNow application. It brings together the final configuration, process lifecycle, security model, testing evidence, achievements and future enhancement areas without repeating the detailed planning and design material.

6.2 Project Overview

The ServiceNow-Based Employee Laptop Request Application is a custom scoped application for centralized employee laptop request management. Employees submit requests through a Record Producer, requests are stored in a custom table, duplicate submissions are validated, managers provide approval, and the final decision is communicated to the employee.

6.3 End-to-End Operational Workflow

The workflow begins with employee submission. Backend validation checks the annual duplicate rule before the request proceeds to manager approval. The manager decision creates one of two controlled outcomes: Approved or Rejected. Each outcome updates the request and sends the appropriate employee notification.

6.4 Final System Inventory

Component	Final Implementation
Application	Custom ServiceNow scoped application
Table	Laptop Request – x_2063774_projec_0_laptop_request
Record Producer	Laptop Request
Business Rule	Laptop Request BR
Automation	Flow Designer
Approval	Manager approval using ServiceNow approval records
Roles	it_employee, it_manager
Groups	IT Employees, IT Managers
Security	ACLs
Deployment	Update Set

6.5 Security Summary

Access Area	Employee	Manager
View requests	Allowed	Allowed
Create requests	Allowed	Blocked
Write requests	Allowed	Blocked
Approval responsibility	Submitter	Approver

6.6 Validation Summary

Validation Area	Outcome
Request creation	Passed
Annual duplicate prevention	Passed
Pending Approval initialization	Passed
Manager approval	Passed
Approved status	Passed
Rejected status	Passed
Approval notification	Passed
Rejection notification	Passed
Role-based access	Passed

6.7 Key Achievements

- Centralized laptop request management.
- Structured request data using a custom table.
- One-request-per-year policy enforcement.
- Automated manager approval using Flow Designer.
- Automated status and email handling.
- Role-based security using roles, groups and ACLs.
- Configuration captured through an Update Set.
- Functional and security scenarios successfully validated.

6.8 Future Enhancements

Enhancement	Potential Value
IT asset inventory integration	Connect requests with available assets.
Automatic laptop assignment	Reduce manual fulfillment work.
IT fulfillment tasks	Track downstream fulfillment activities.
Laptop availability checking	Validate availability before fulfillment.
SLA management	Measure and manage request timelines.
Advanced approval rules	Support more complex approval conditions.
Reporting dashboards	Provide management visibility.
Request analytics	Identify request trends.
Asset delivery tracking	Track delivery after approval.

6.9 Project Conclusion

The completed application provides a controlled digital lifecycle for employee laptop requests. It combines structured data capture, backend policy enforcement, manager approval, automated status handling, notifications and role-based access. The implementation demonstrates practical ServiceNow application development and provides a foundation for future IT asset and fulfillment enhancements.
